

Explore and note:

➤ Which observations regarding word embedding similarity can you make in the projection? Mention at least 2 word pairs as examples.

Solution:-

grant and give - They are close together on Law2vec projections but far away from each other in GloVe.

Grant and institution are close together in Glove but far away from each other in Law2Vec

➤ Also, write about why you chose to plot both embedding datasets in one plot or each one separately.

Solution:- I chose to plot the models on the same graph to observe how the same words near/far from each other in the projected vectors of the two models. How the word meaning groupings were different from each other.
